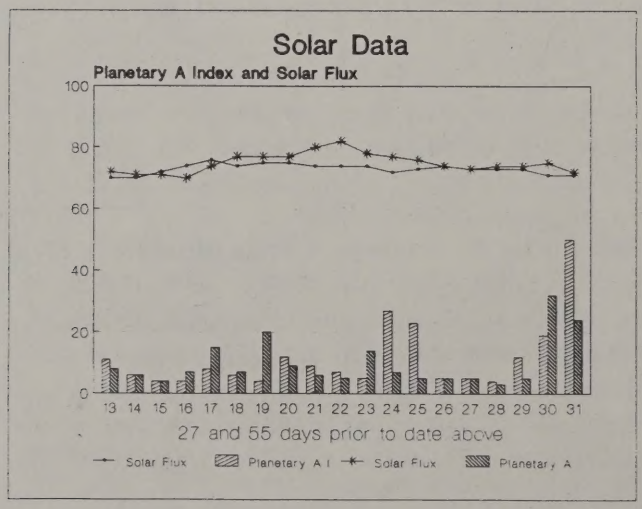
Propagation Watch

The first week of October was marred with strong geomagnetic storms, essentially destroying what little propagation was left by the weak ionosphere. While east-west propagation remained relatively unaffected, the high-latitude and polar paths essentially vanished. The **CYØTP** Sable Island DXpedition didn't work a single Japanese station for the first few days of their operation, for example.

The forecast is for the geomagnetic activity, which is due to persistent coronal holes, to end, and for the bands to improve dramatically for most of the rest of the month. With the exception of a possibility of increased geomagnetic activity around Oct. 24-25, the forecast is for above average band conditions until the last couple of days in October.

The preliminary forecast for the CQWW SSB is for High Normal conditions. Geomagnetic activity is expected to increase throughout the weekend, however, so contesters should make the maximum use of the first day, in case conditions deteriorate on Sunday. Even a single significant sunspot can boost solar flux enough to open 15 meters, so keep an eye on solar flux values. And don't forget the excellent north-south propagation on 10 meters.



DXCC Processing Status

A flood of applications prior to the yearly Honor Roll cutoff on Sept. 29th swamped the DXCC desk last month. This more than tripled the backlog of unprocessed applications. At the end of September, the DXCC desk faced 991 such applications with 70,803 cards, compared to 363/21,125 one month previous. In September, they received 1,254 applications with 82,230 cards, and processed 626 with 32,552 cards, down from the previous month due to absent staff. Most previously computerized applications are being turned around in less than two weeks.
